# CGCEO - Center for Global Change and Earth Observations

## Our Mission Is:

To specifically address the international aspects of the coupled social, land and climate systems in global environmental change studies using advanced geospatial tools, models, and observations

## Our Goal Is:

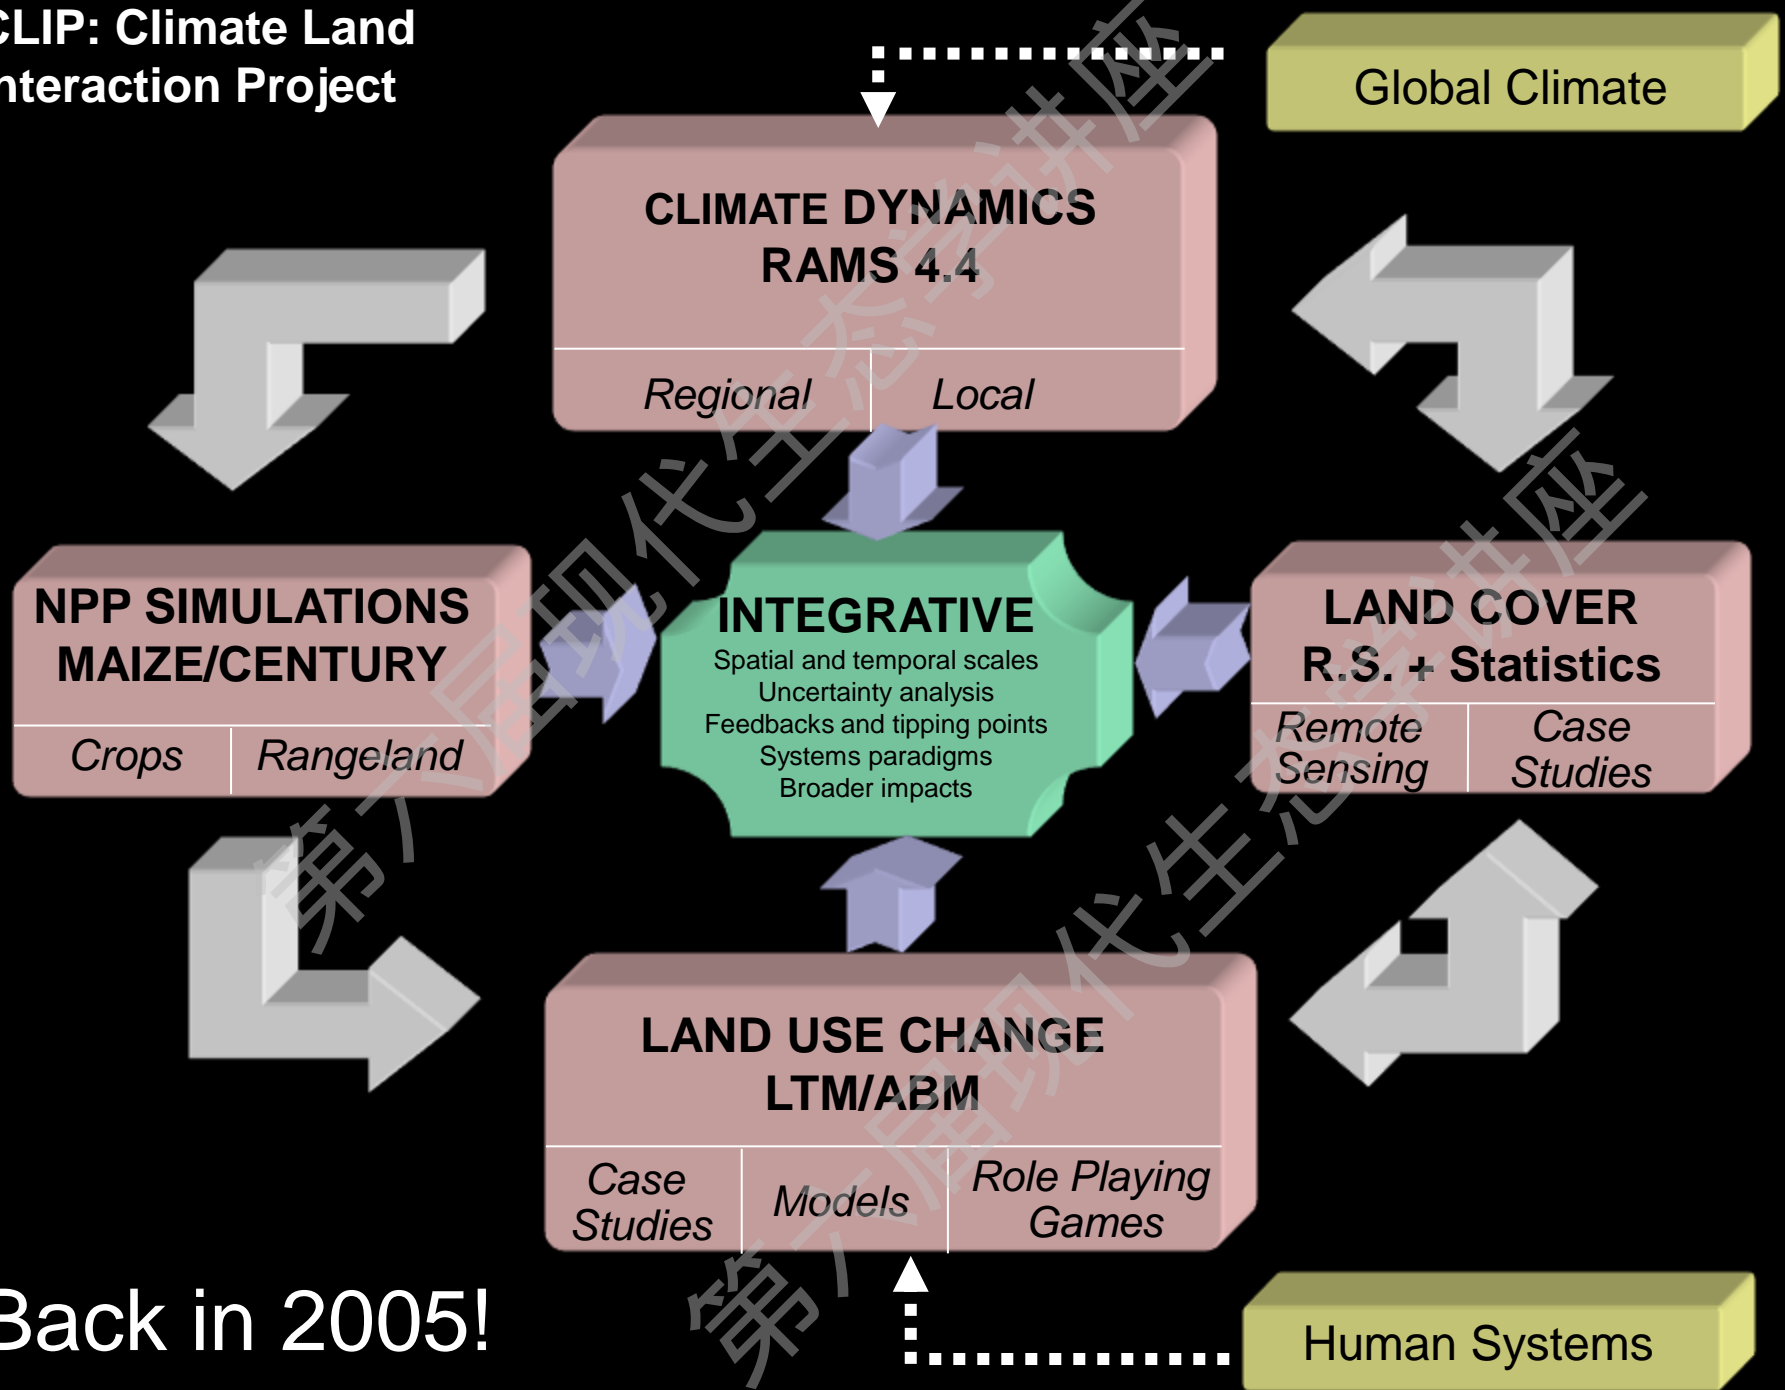

To improve our understanding of the interrelations among the human, land, and climate systems in the global context

Global to local scales

# CLIP: Climate Land Interaction Project

Back in 2005!

# OUTLINE

- Climate Change - Known and unknown
- A System Approach
- Southeast Asia - Where and why
- One of the Pathways
  - Ecological Consequences

第六屆現代生態學講座

# Unit of Analysis & Scale

- Unit of analysis:
  - Representativeness is space and time?
- Scale:
  - Geographic areas
  - Time scale to capture true dynamics
- Interpretation of the results (yours and others!)

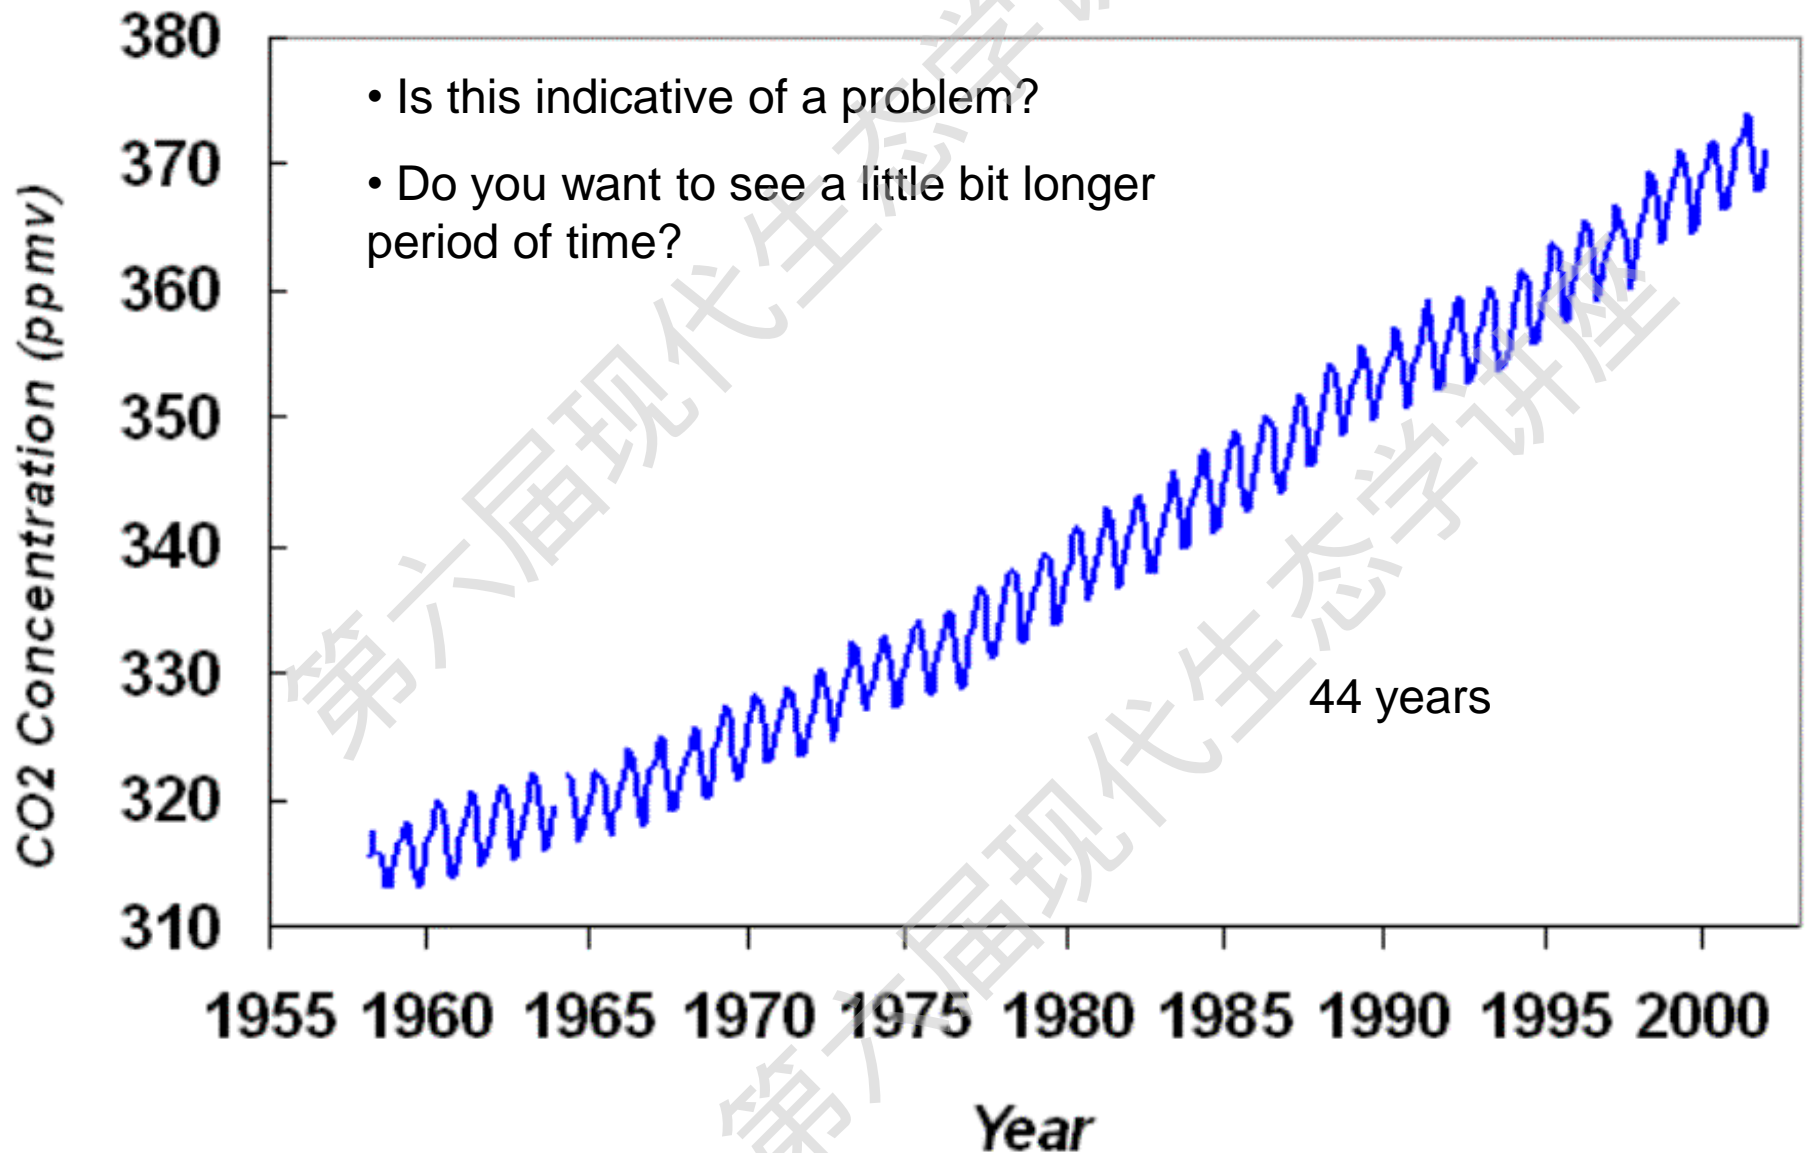

# Terms

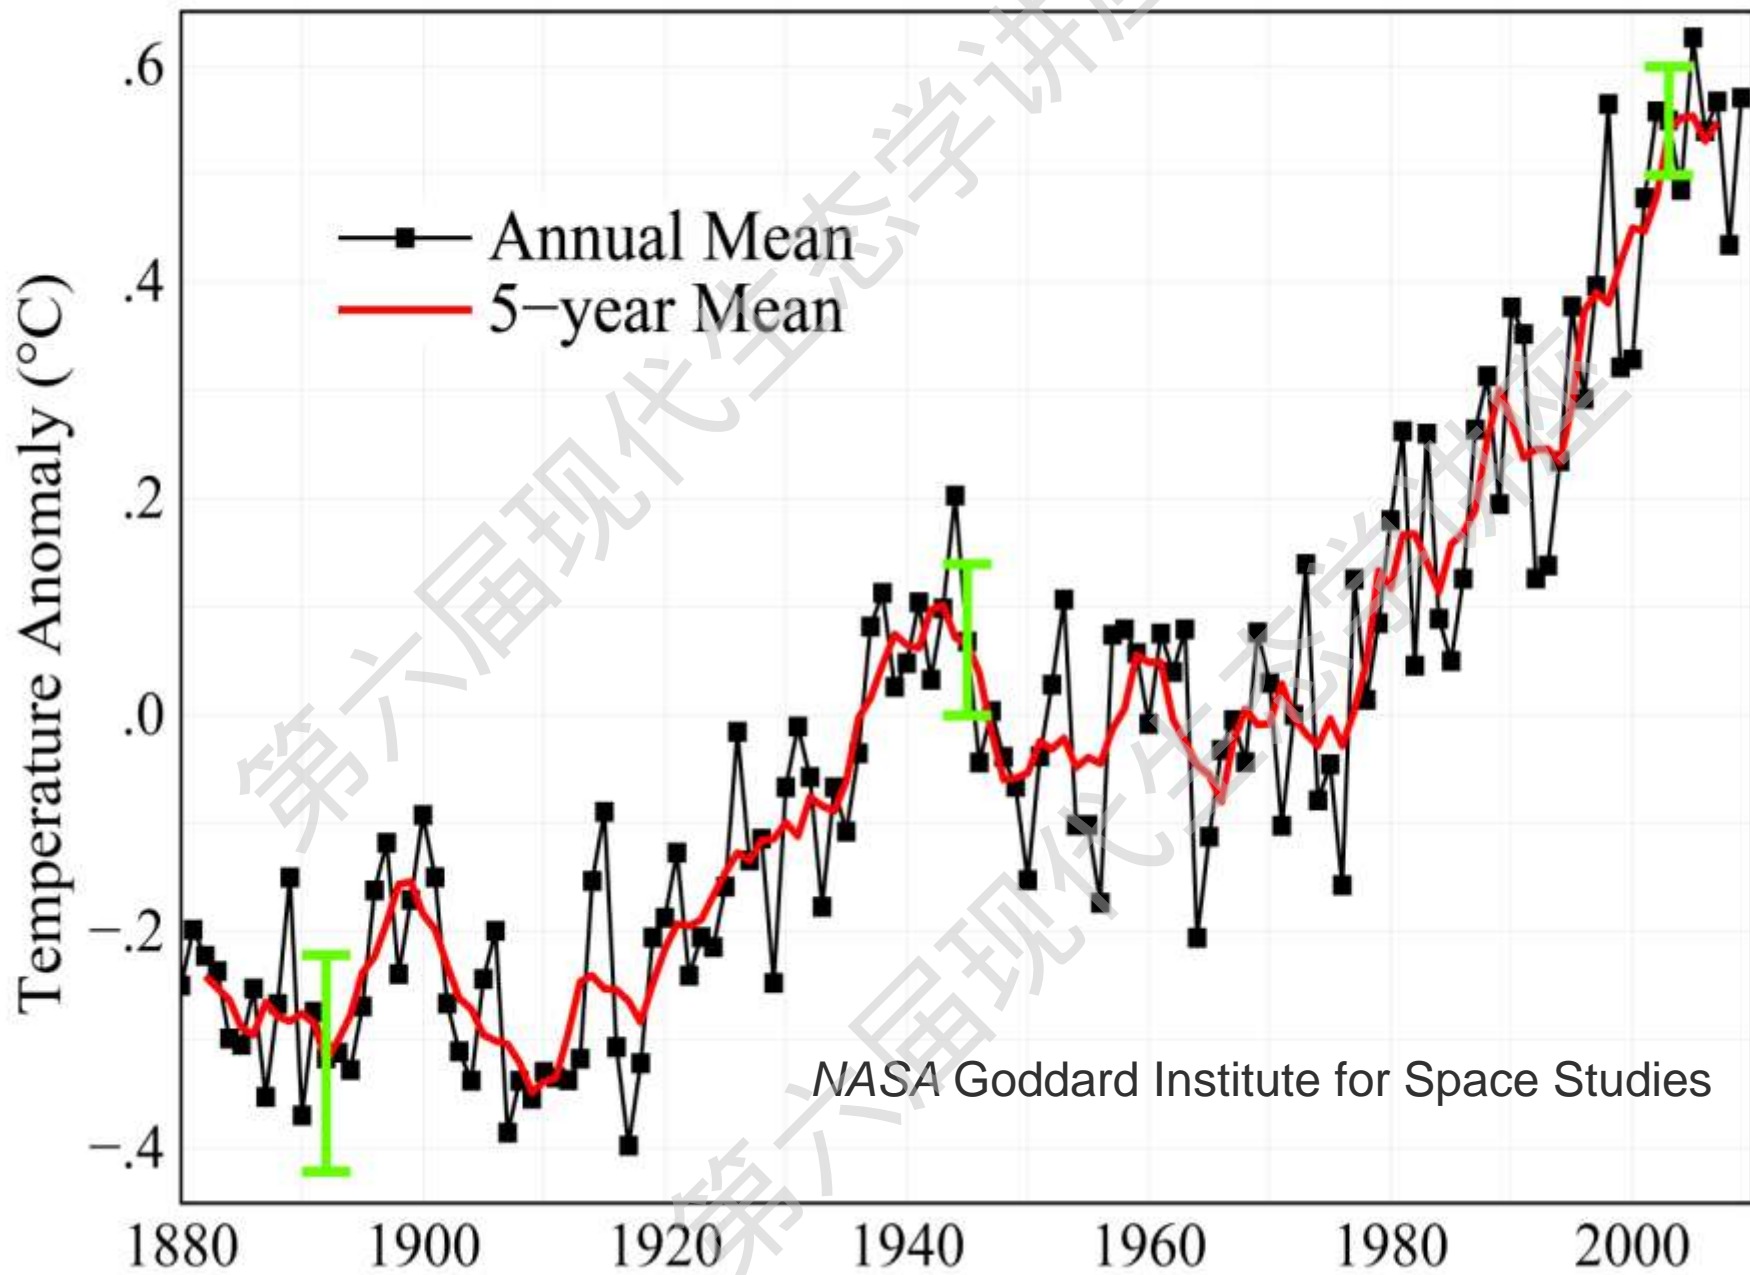

- Various terms have been used but they mean different thing by different community and discipline!
  - Global change?
  - Climate change?
  - Global warming?
  - Climate variability?
  - Climate trend?
  - Climate forecastings?
  - Climate scenario?
  - Climate projection?

# Atmospheric CO2 Concentration - Mauna Loa Observatory 1958 - 2002

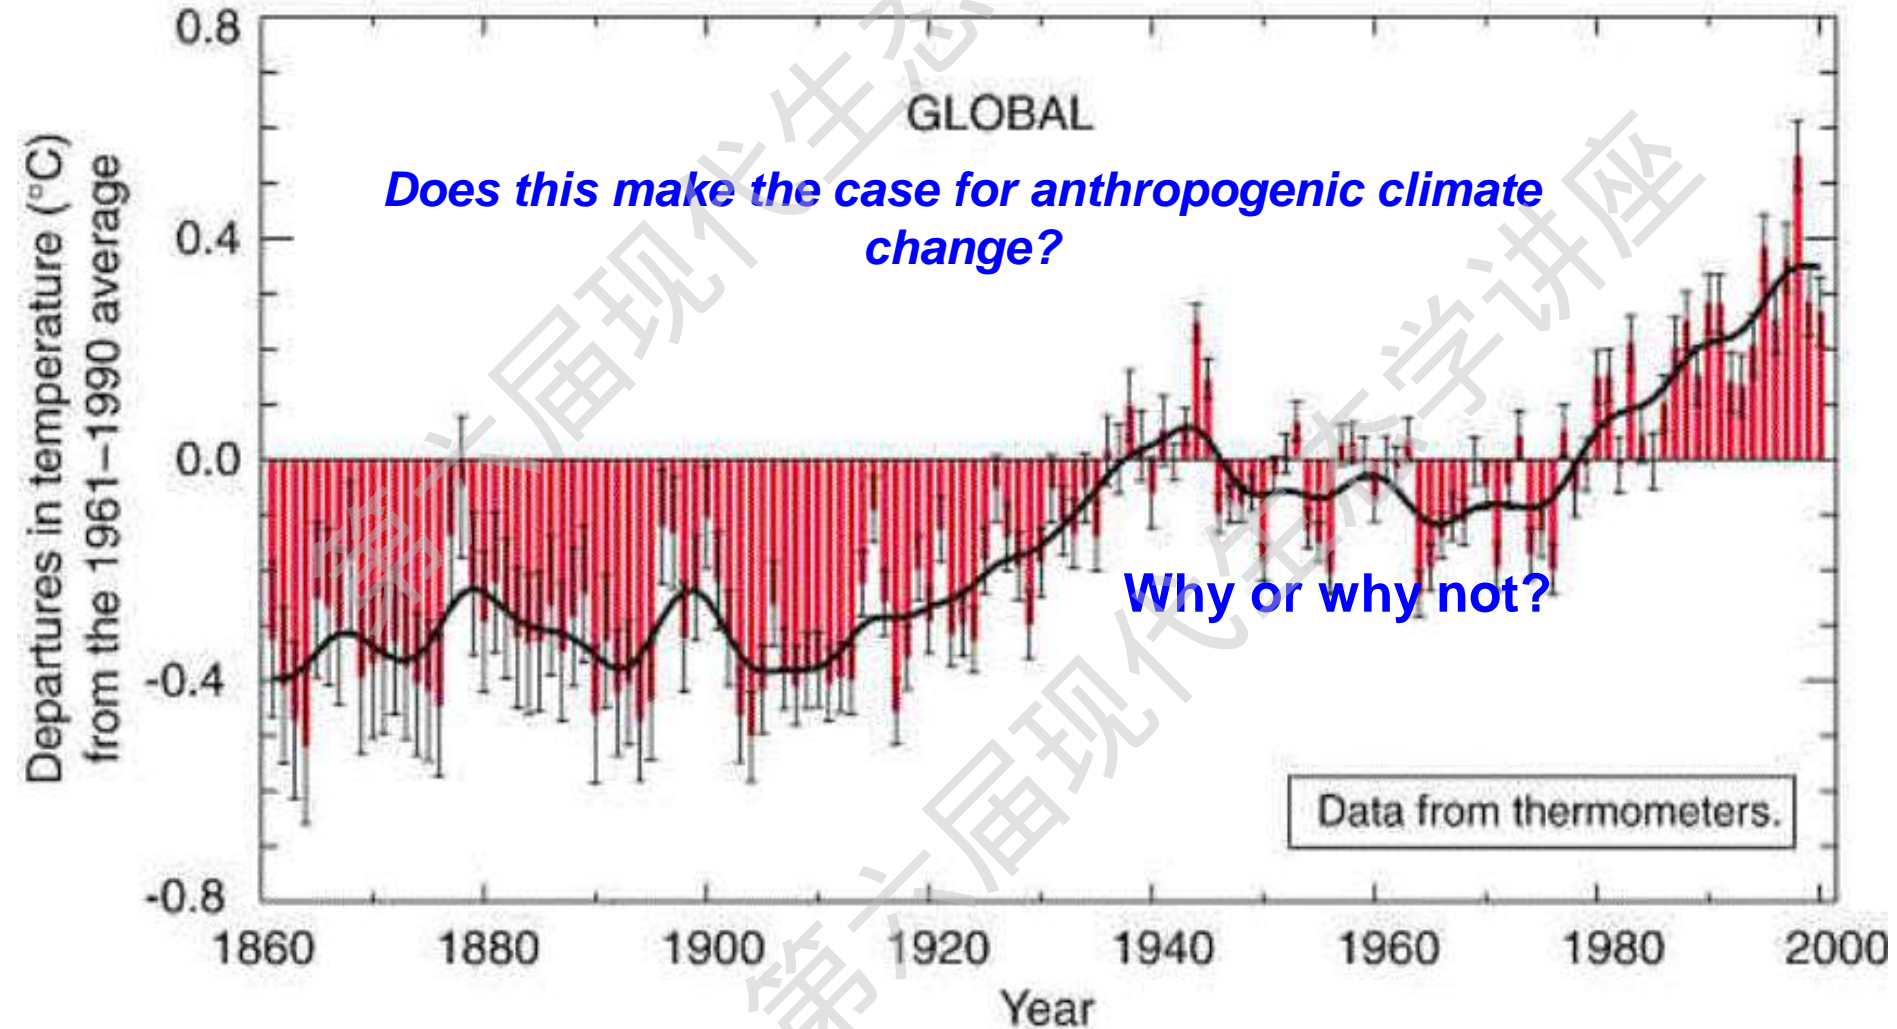

# Global Land–Ocean Temperature Index

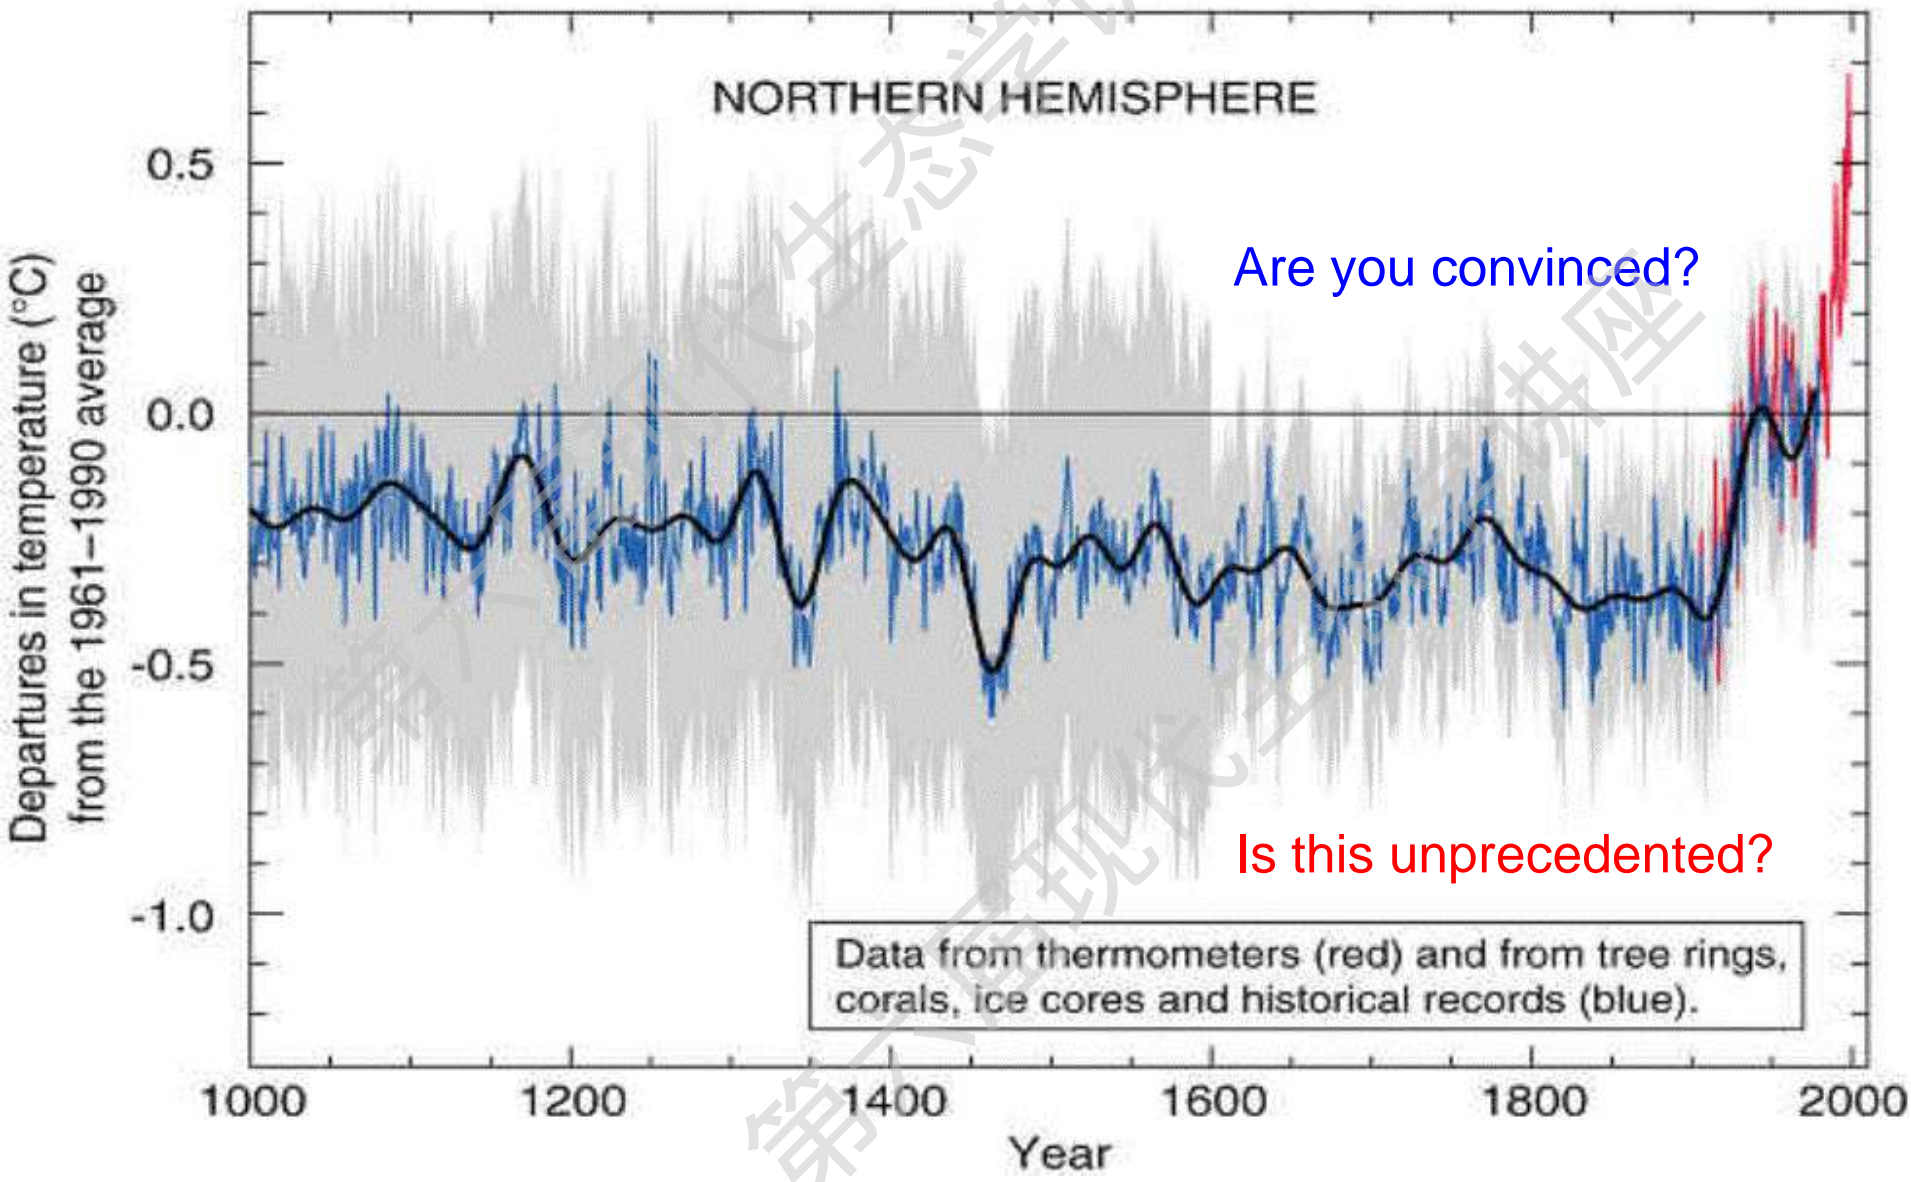

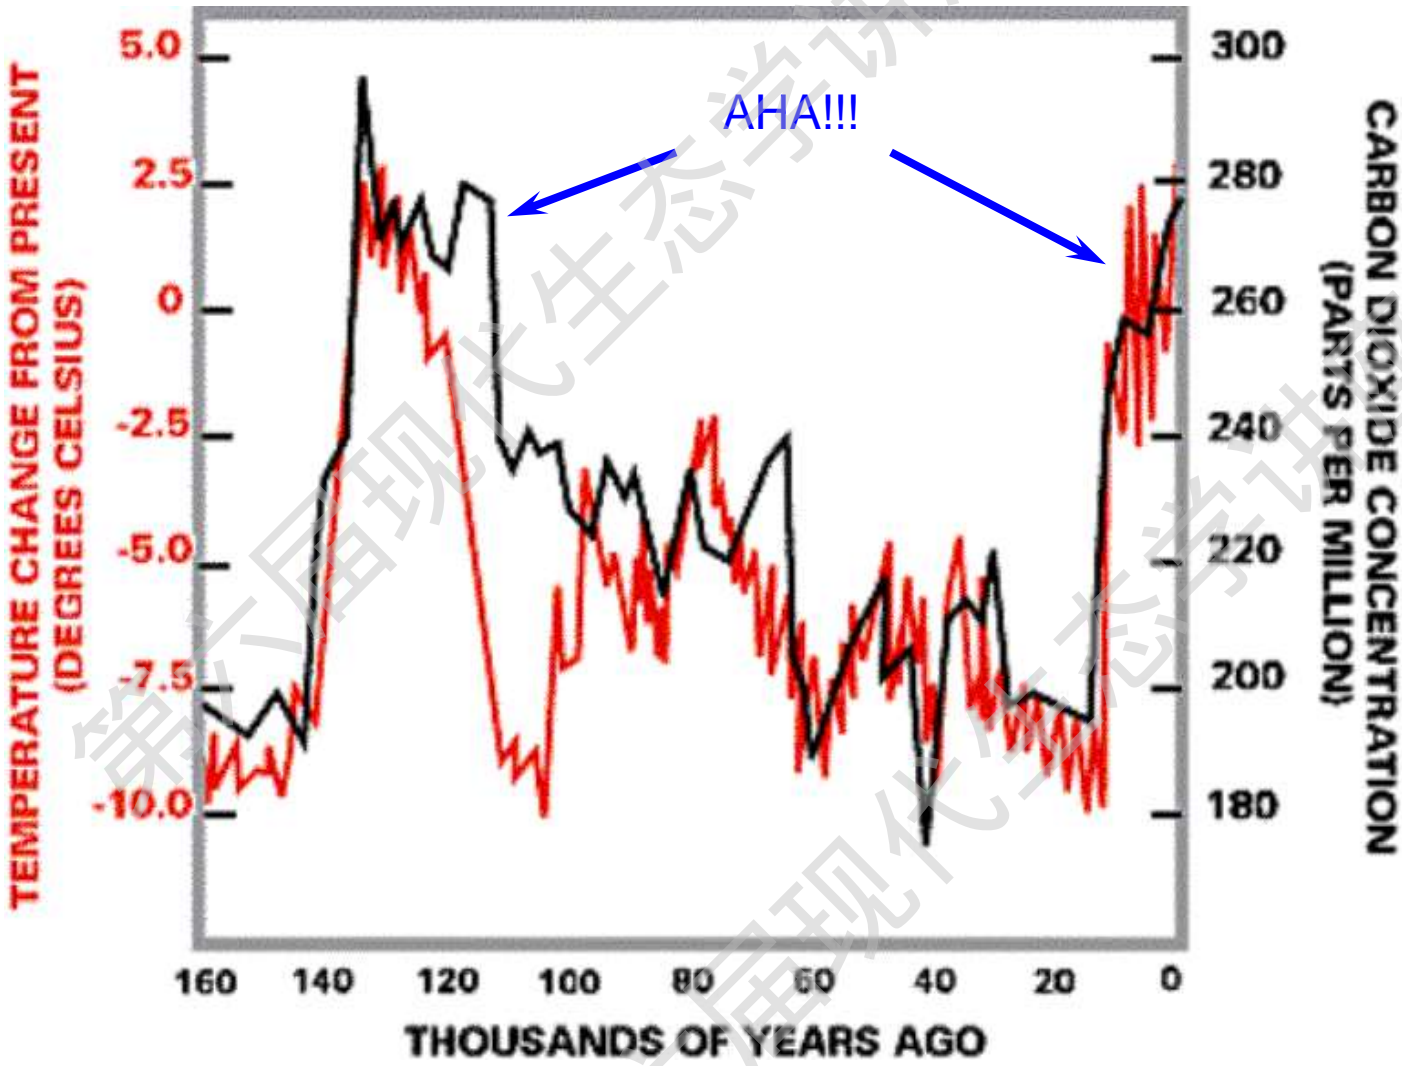

# Climate Change

(a) the past 140 years

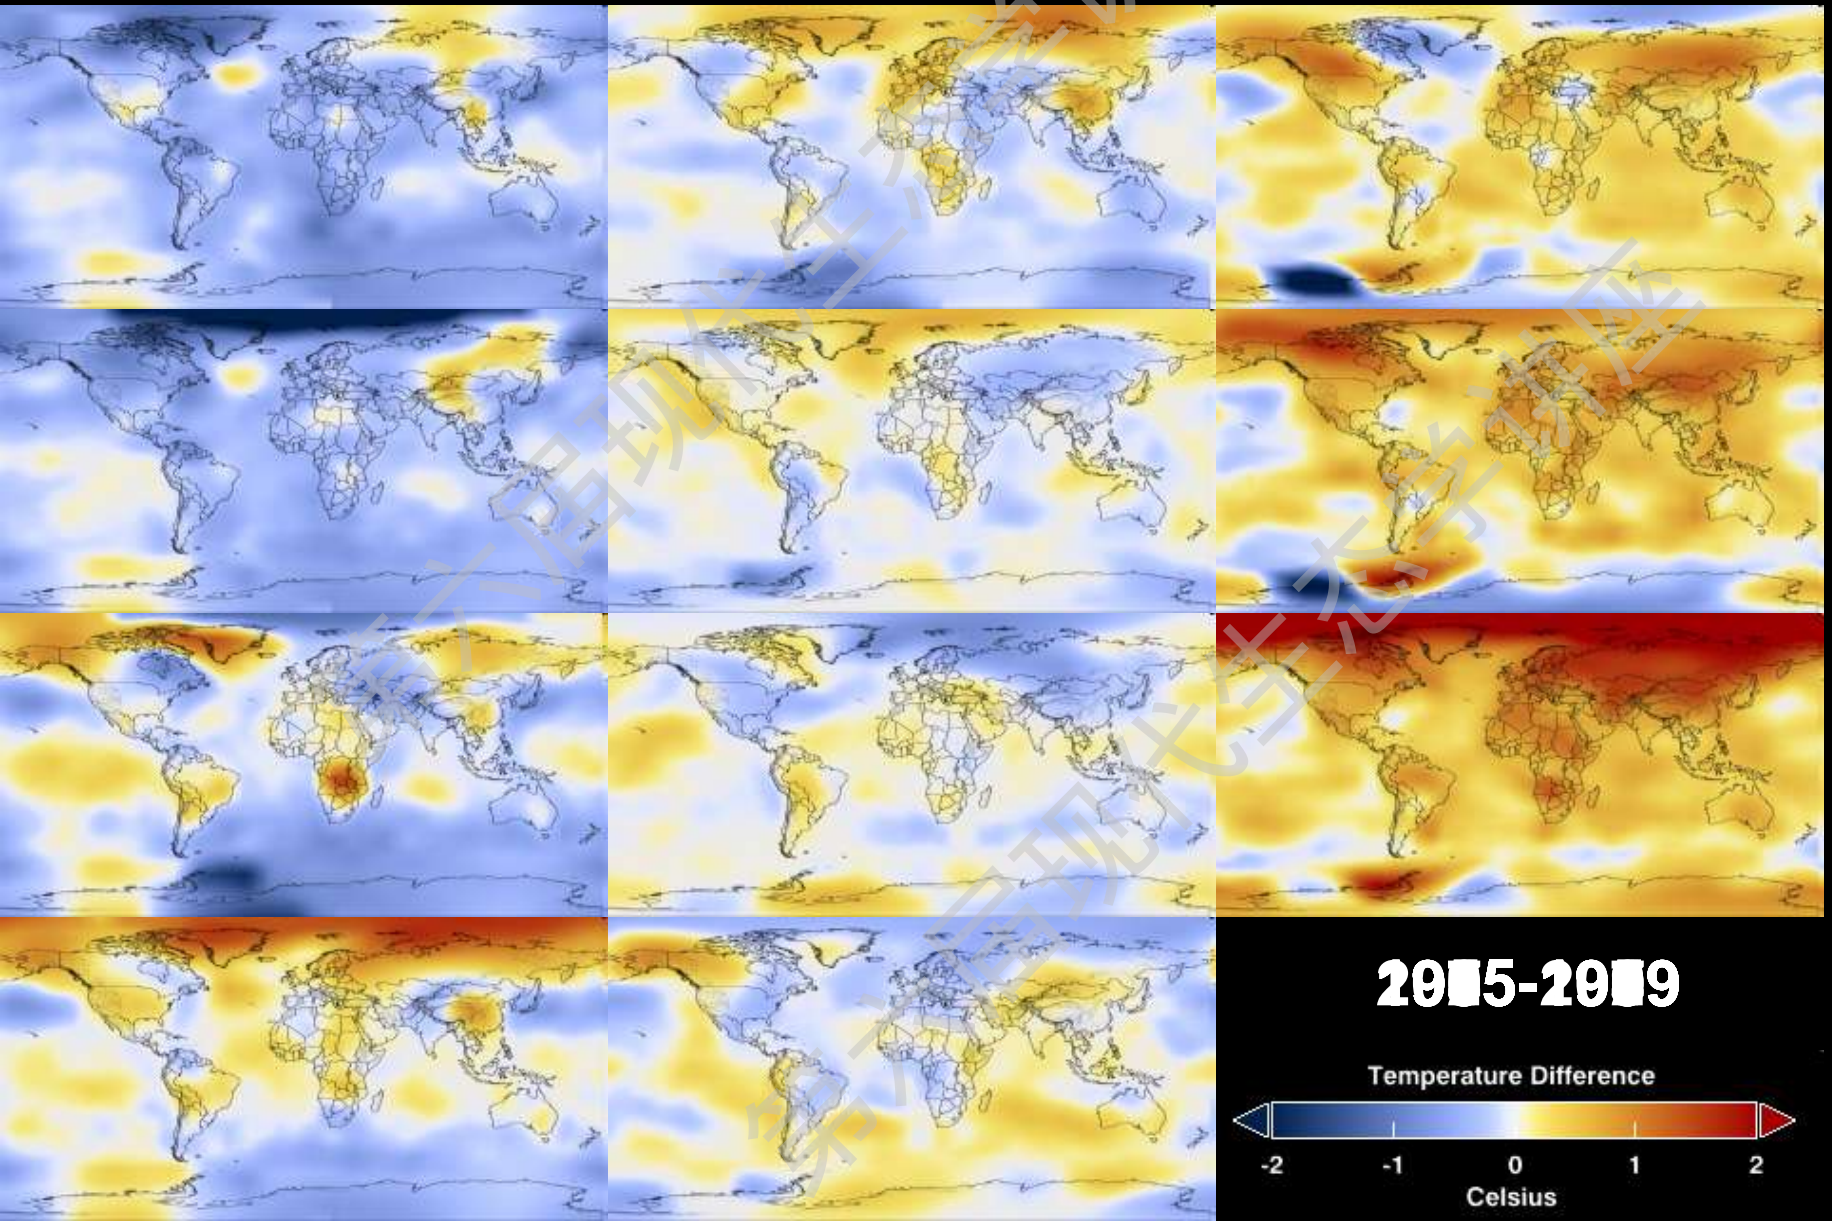

**(b) the past 1000 years**

So we don't have to worry about global warming or do we?

# Five-Year Average Global Temperature - Anomalies from 1909 to 2009

# Who are the big players?

SOURCE: U.S. ENERGY INFORMATION ADMINISTRATION, 2007 NUMBERS; REPRESENTS TOTAL CO<sub>2</sub> EMISSIONS FROM THE CONSUMPTION OF ENERGY; INCLUDES ONLY 9-20 COUNTRIES, WHICH REPRESENT 90% OF THE WORLD'S ECONOMIC OUTPUT  
PHOTOS: JUPITERIMAGES

# CO<sub>2</sub> emissions from land use change

# Known and Unknown

- Happening now
- Will continue
- Related to Us

第六届现代生态学讲座

# Known and Unknown

- Happening now
- Will continue, at least in the short term, say 50 years!
- Related to human activities, at least to a large degree!
- What is the magnitude due to human?

# Known and Unknown

- Some key issues are largely unknown:
  - Variability
    - Extreme events
    - Temporal frequency
    - Extent
  - Synchronization of temperature and precipitation
  - Forecasting in space and time!

# Known and Unknown

- Ecological and societal consequences are largely unknown:
  - Ecosystem services and functions
  - Resilience and adaptive capability
  - Thresholds and tipping points
- Adaptation Options are largely unknown
  - Conceptual framework proposed long time ago but implementation is largely unknown

# Recent NRC Report on “America’s Climate Choices”

- **Research** to Improve Understanding of Human-Environment Systems:
  1. Climate *Forcings*, *Responses*, *Feedbacks*, and *Thresholds* in the Earth System;
  2. Climate-Related Human *Behaviors* and *Institutions*
  3. *Vulnerability* and *Adaptation* Analyses of *Coupled* Human-Environment Systems
  4. Research to Support Strategies for *Limiting* Climate Change
  5. Effective Information and *Decision-Support* Systems
- **Tools and Approaches** to Improve both Understanding and Responses:
  1. Integrated *Observing* Systems
  2. Improved *Projections*, Analyses, and Assessments (both climate and impacts)

# A System Approach

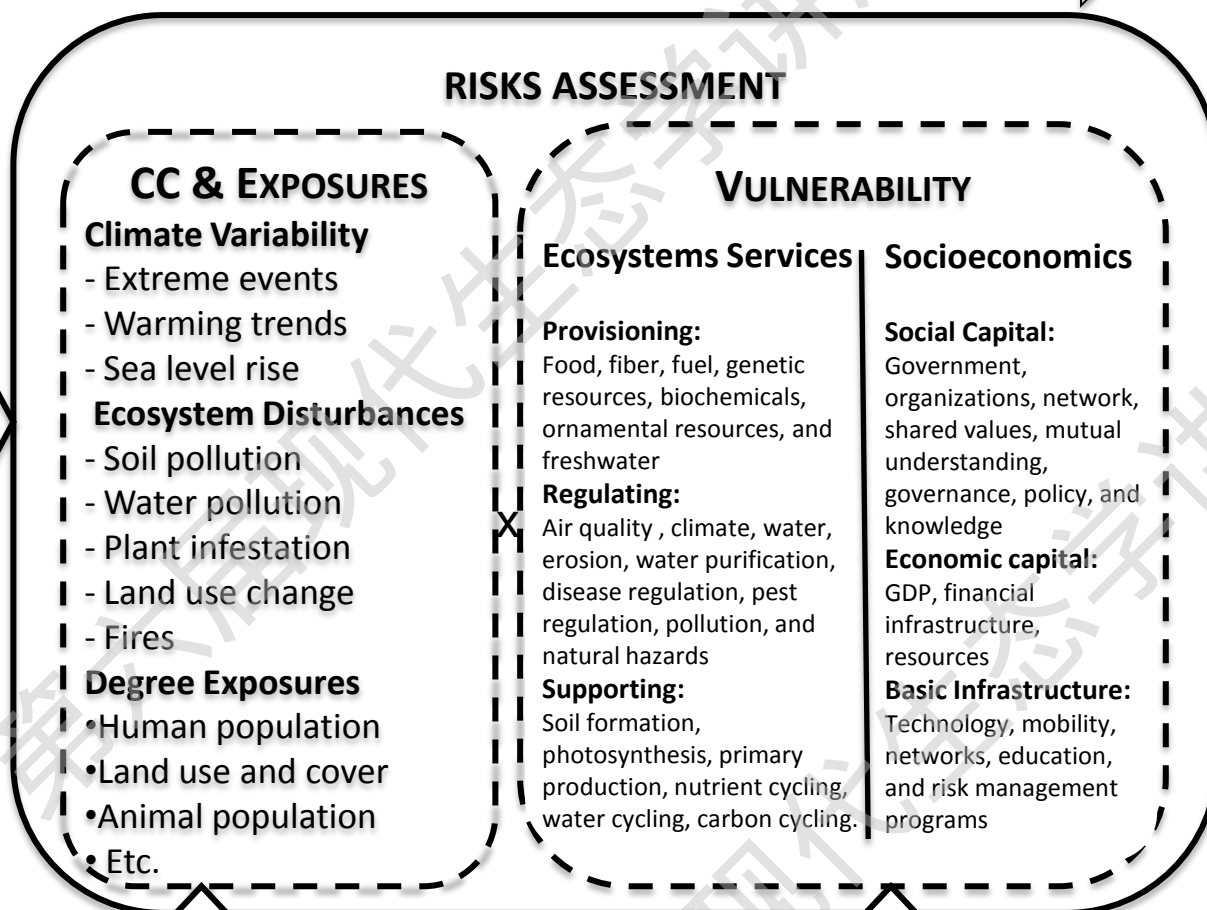

One can not separate climate change from physical and socioeconomic processes!

Ecological Consequences:

**Case Study in Southeast Asia**

# Southeast Asia

第六届现代生态学讲座

第六届现代生态学讲座

# SEA

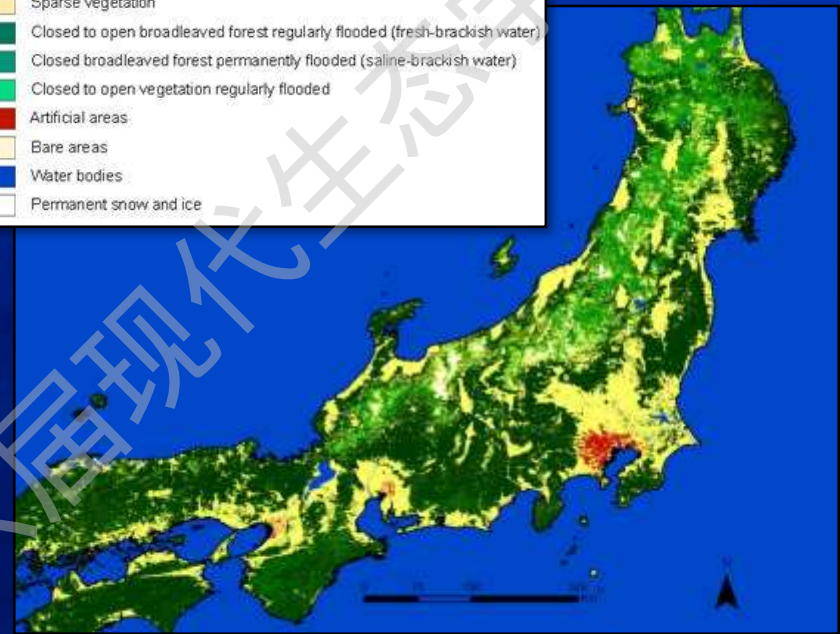

- Most dense population
- Largely developing
- Influenced most by climate change
  - Sea level rises - Many mega cities on shorelines
  - Tightly influenced by monsoon system
  - Glacier retreats - Mekong River recharge
  - Intensive human activities

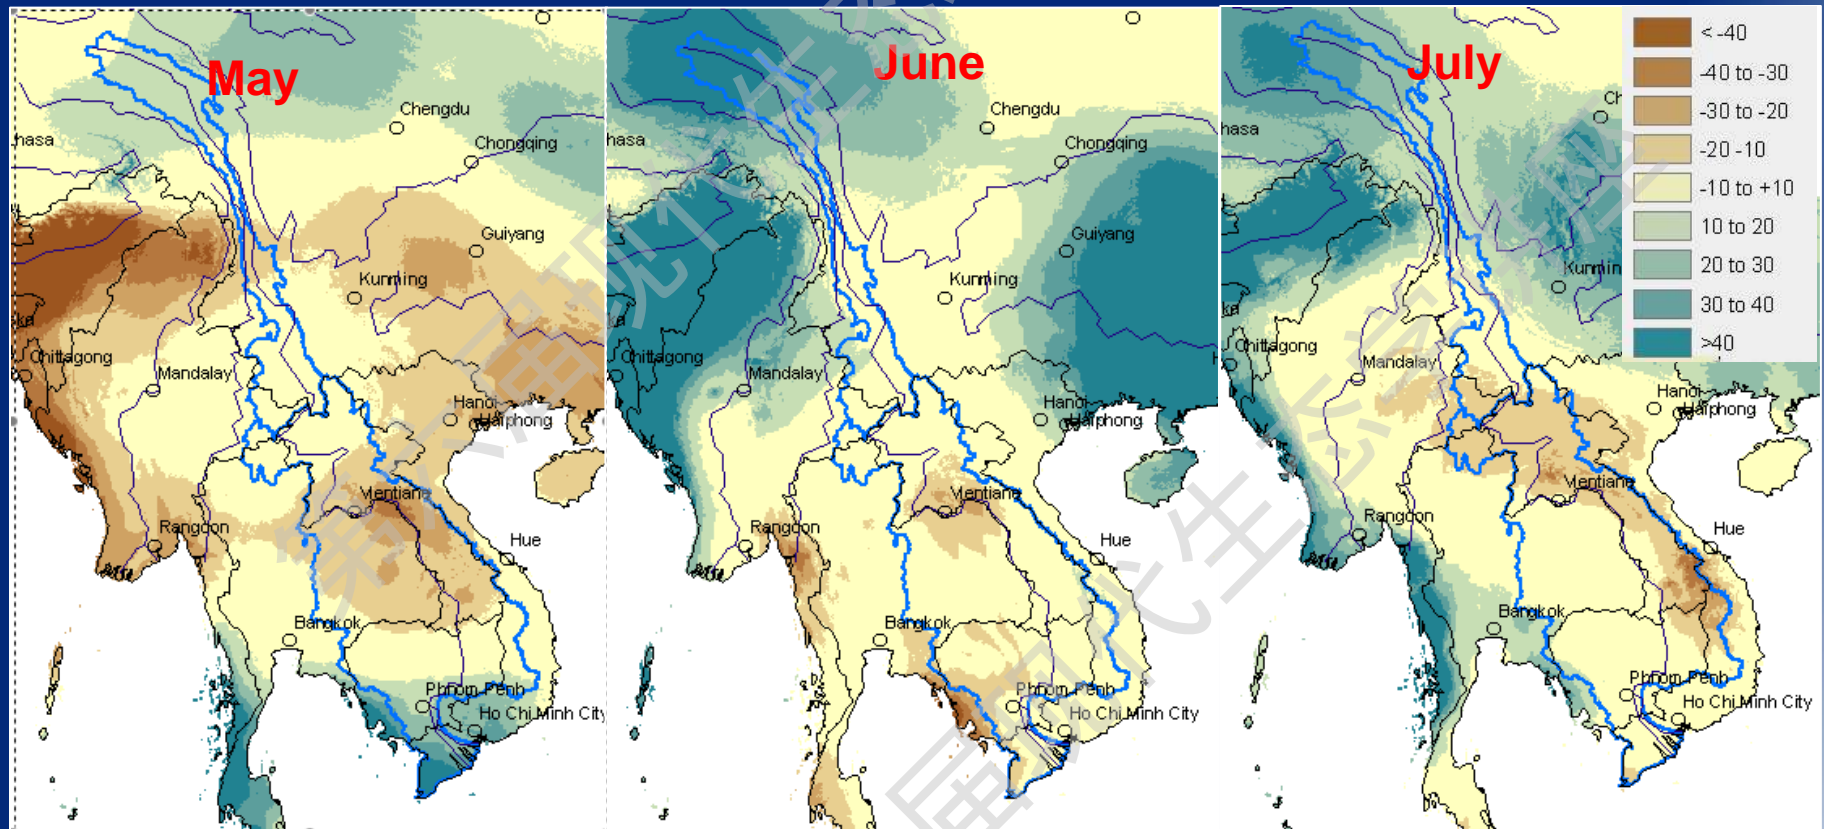

# Land Use and Land Cover Indochina & Japan

From the Global  
Land Cover 2005  
v2.2 Product

# SEA will experience significant climate change - variable

# SEA Ecosystem Dynamics

第六届现代生态学讲座

第六届现代生态学讲座

# Ecosystems

- ▣ Ecosystems are temporally dynamic
  - ▣ Annual and inter-annual variability
  - ▣ Short and long term resiliencies to external disturbances
- ▣ Multiple ecosystem types interact and influence one another across broad spatial scales
- ▣ Important ecosystem attributes include: land cover composition, vegetation dynamics, climate, topography, and species diversity, among others
- ▣ Analysis of ecosystem dynamics requires continuous monitoring at large spatio-temporal scales

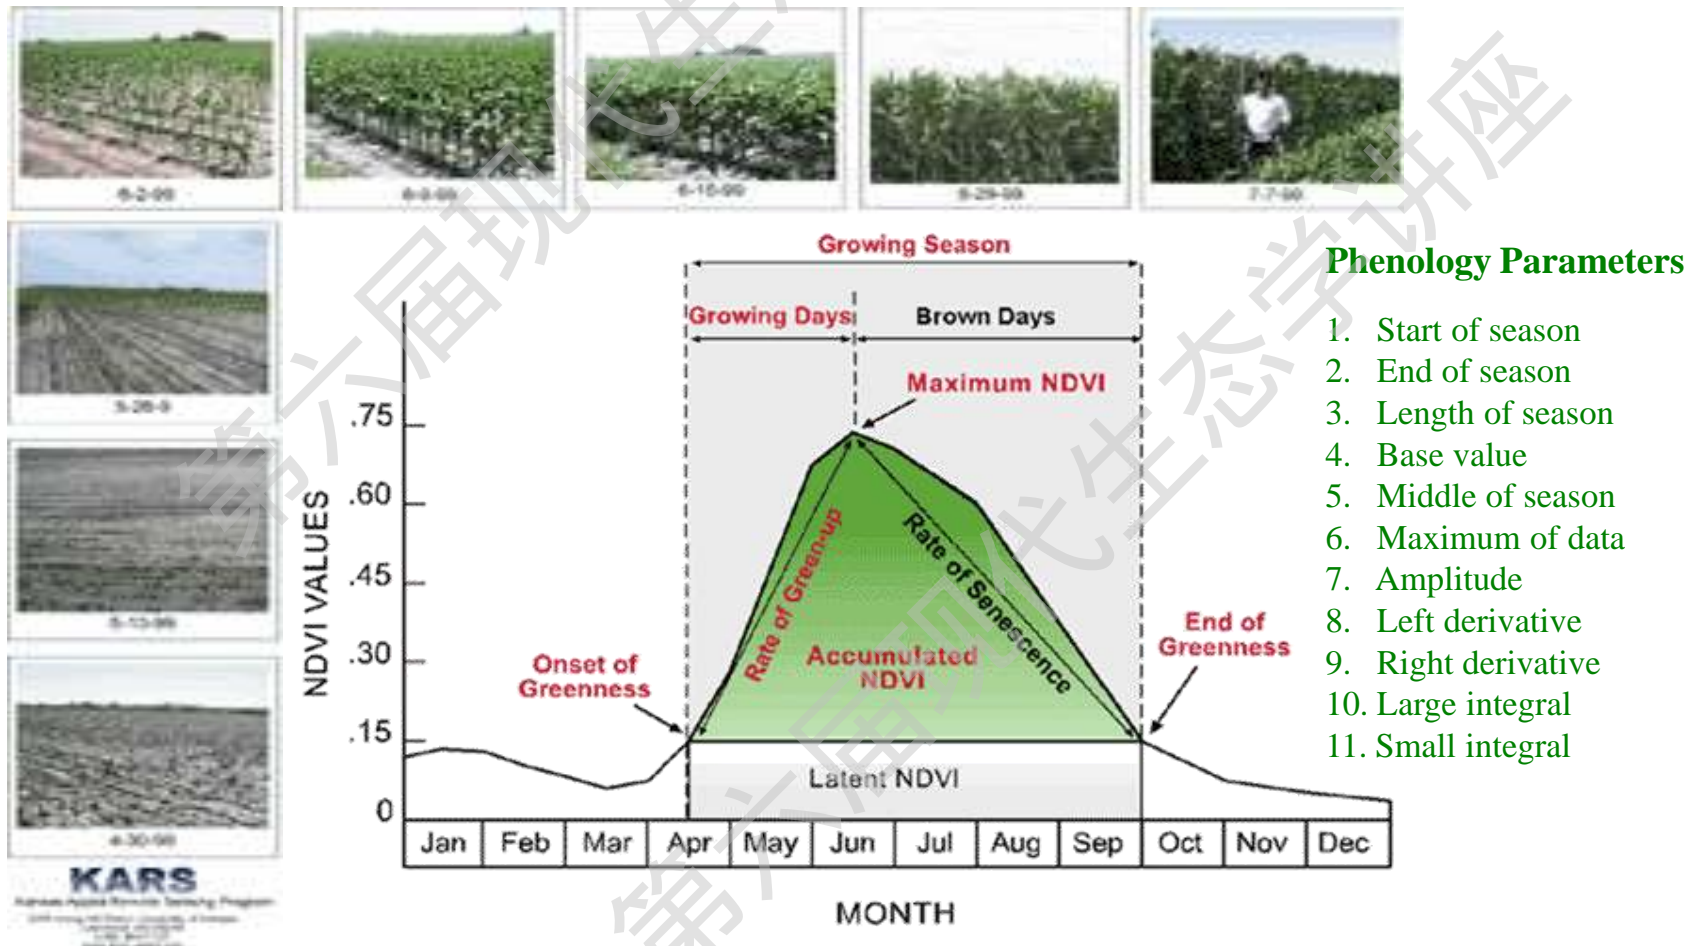

# One Particular Attribute: Vegetation Phenology

- ▣ The periodic biological events in the plant world or the timing of different stages of the vegetation seasonal cycle
- ▣ Influenced by the environment, especially temperature changes
- ▣ Emerging indicator of landscape and global environmental changes

# Phenology

The timing of different stages of vegetation seasonal cycle, such as leaf unfolding, first bloom, and leaf fall, as influenced by the environment (Schwartz, 2003)

# Drivers of Ecological Change

## ▣ Human Activities

- Population Growth
  - Agricultural Expansion & Intensification
  - Urbanization
- Economic Growth
  - Infrastructure
  - Resource exploitation?
  - Deforestation

## ▣ Ecological Impacts

- Ecosystem Degradation
- Habitat Destruction & Fragmentation
- Loss of Biodiversity
- Species Migration
- .....

## ▣ Climate Change

- Altered Temperatures & Precipitation Patterns
- Increased Floods & Droughts

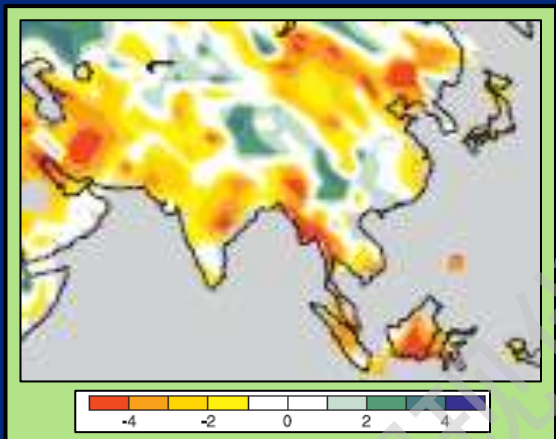

# Specific Objective

## Assess Large-scale Ecological Changes under Climate Change

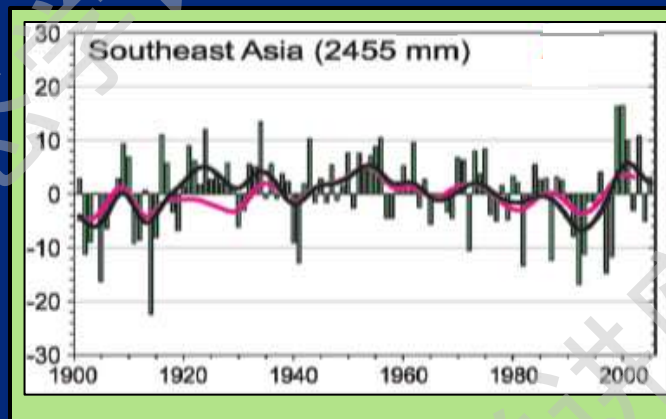

- Develop effective methods for **monitoring** large-scale **ecological change** using moderate resolution **satellite imagery** and ground observations for Southeast Asia
- Quantify **phenological attributes** and their ability to provide unique **ecological information** about **ecosystem dynamics**
- **Disseminate information** via web-based tools to the general public and resource managers for **effective ecosystem management**

# Phenology seen from MODIS

MODIS 16-Day EVI Composites  
2000 - 2008

EVI Seasonal Profiles and Phenological Parameters

Phenology Curve

PHENOLOGY PARAMETERS	DESCRIPTION
a) Start of the growing season	The first date which the value has increased
b) End of the growing season	The last date which the value has decreased
g) Length of the growing season	The number of days between the start and the end date
f) Amplitude of the growing season	The difference between the peak value and the start and the end date
i) Large integral	The total vegetation production
h) Small integral	The seasonally active vegetation

# The Phenology Curve

- ▣ Fitted Curve Function: **Savitzky-Golay Filter**
  - Least -squares polynomial regression for each point to fit curve
  - Adapts for upper envelope of EVI time-series profile
  - Preserves features of data distribution
  - Captures rapid phenology changes

$$Y_j^* = \frac{\sum_{i=-m}^{i=m} C_i Y_{j+i}}{N}$$

$Y$  = original EVI value

$Y^*$  = resultant EVI value

$C_i$  = coefficient for the  $i^{\text{th}}$  EVI value of the filter

$N$  = filter size ( $2m+1$ )

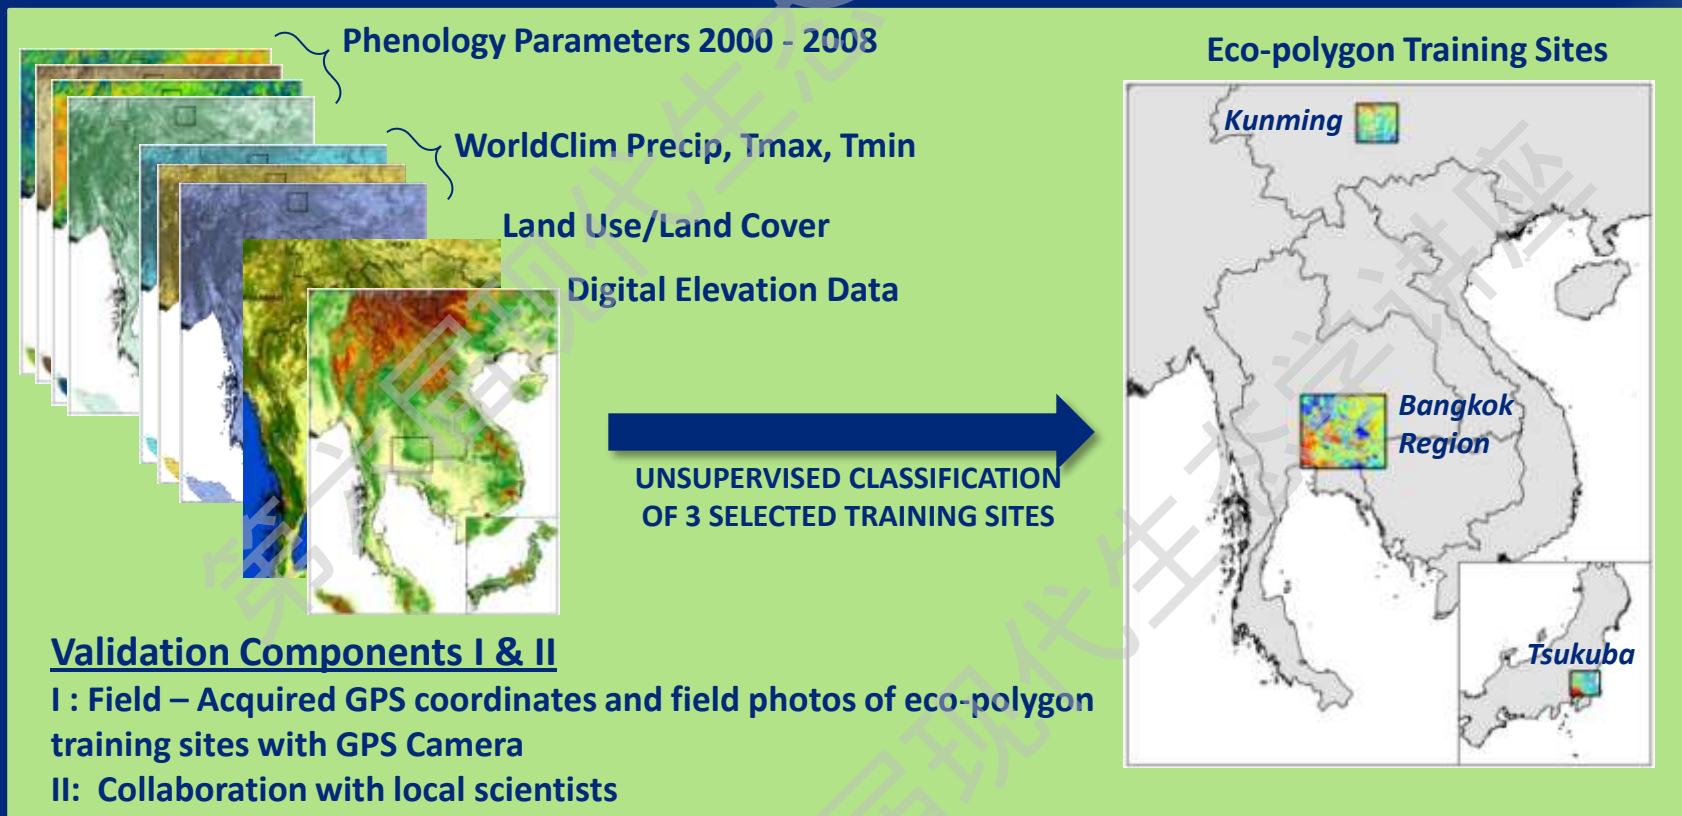

$j$  = running index of the original ordinate data table

$m$  = half-width of smoothing window

(Chen et al., 2004)

ough  
a starts  
region

shift  
ng  
The anomaly during 2000 coincided with

El Nino

# End of Growth

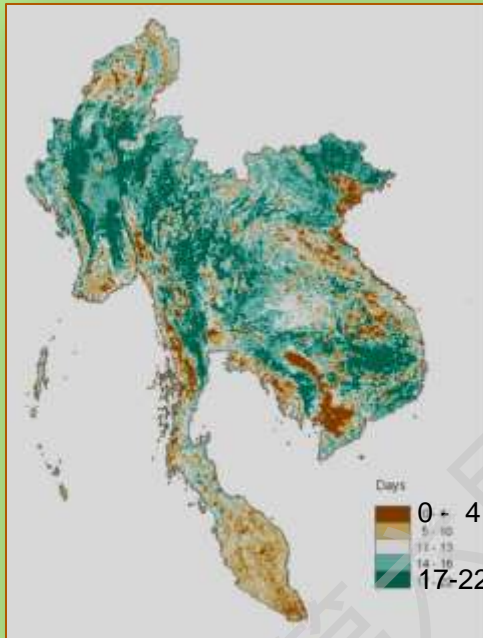

- 
- 

• The length of the growing season is decreasing

• The end of the growing season itself is occurring earlier each year

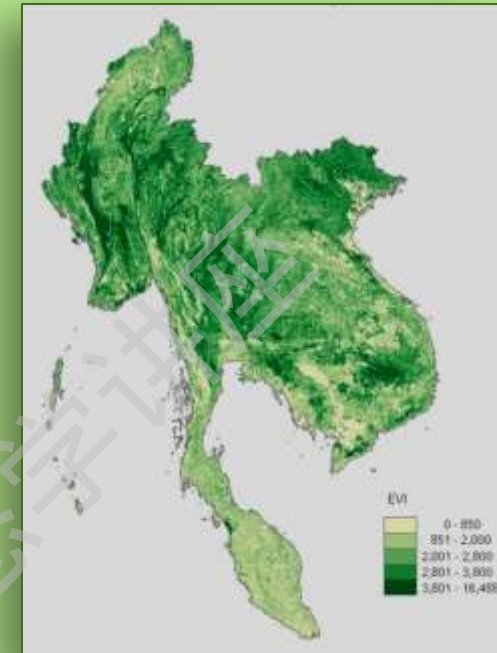

## Length of Growing Season

- The growing season is generally longer in the northwest through the central portions of the Peninsula
- Likely due to moisture-rich environments, evergreen forests, and crops with longer growing seasons

- A large part of the eastern Peninsula experiences shorter growing season lengths
- This trend is supported by the general pattern of starting and ending dates

## Amplitude of Growing Season

- Indicator of overall vegetation amount within the growing season
- Varies greatly across the Peninsula
- Relatively low amplitudes are found in the agricultural and dry areas in the eastern and central parts of the Peninsula
- The highest amplitudes are found in the north-northwest, where there is a mix of vegetation development and evergreen forests

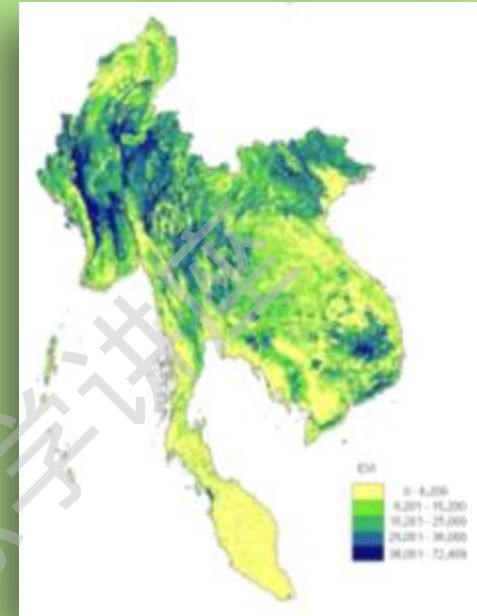

## Large Integral

- Represents annual net primary production
- High production found in evergreen and deciduous forests in the north/northwest, East and the south represent low production

- The large integral is related with the amplitude of the growing season: ***areas with higher amplitude generally have higher values of total vegetation production***

## Small Integral

- Indicates seasonally active vegetation or seasonal change in net primary production
- Also positively associated with large integral
- Some agricultural and dry areas have lower values which suggests low productivity (likely due to less rainfall)

# Eco-Polygons

# CONCLUSIONS

第六届现代生态学讲座

# Conclusions

- ▣ A guideline for future ecological analyses:
  - An alternative method to assess phenology in Southeast Asia
    - ▣ Based on seasonal information
    - ▣ Identified phenology characteristics of multiple growth cycles
    - ▣ Identified vegetation dynamics that may be related to large-scale climate events (e.g., El Nino)
- ▣ A widely applicable framework
  - Extend study periods and/or areas

# Limitations & Future Directions

- ▣ Temporally limited data set (i.e., 9 years)
- ▣ Need for validation
- ▣ Need to understand ecosystem dynamics and disturbances for future adaptation strategy development in the region
- ▣ Integration with previous research to assess global climate change
